

Causes of volatility in cryptocurrencies

Volatility is very important for

- Investment analysis
- Risk management
- Decision making and Portfolio optimization

Understanding the factors which drive the fluctuations of cryptocurrencies and to what extent the volatility is predictable is a practical problem

Coins

- Bitcoin
 - The largest market capitalization
- Ethereum
 - Software platform
- XRP
 - Decentralized
- IOTA
 - Transactions between Internet of Things
- Binance Coin
 - Coin Used for fees on Binance Exchange

Historical data

	Number of observations	Start date	End date
Binance Coin	1313	2017-07-26	2021-02-27
Bitcoin	2862	2013-04-29	2021-02-27
Ethereum	2031	2015-08-08	2021-02-27
IOTA	1355	2017-06-14	2021-02-27
XRP	2764	2013-08-05	2021-02-27

- In addition to features related to Bitcoin price, we use the average past 10-day sentiment for Bitcoin-related news on Coindesk
- Target is the future 10-day volatility

Data preprocessing

- Calculating percentage changes
 - Replacing infinite values with zeros
- Min-max scaling
- Changing dimensions

Sentiment data

- Coindesk as the data source
- Preprocessing text is one of the most important steps
- Steps:
 - Remove punctuation, stop words, and numbers
 - Convert to lower case
 - Converted to document term matrix
 - Use stemming
 - Limit word lengths to between 5 and 20
- Library SentimentAnalysis
- Sentiment for each news was calculated
 - Loughran-McDonald dictionary for financial data
- Average daily sentiment was calculate per coin

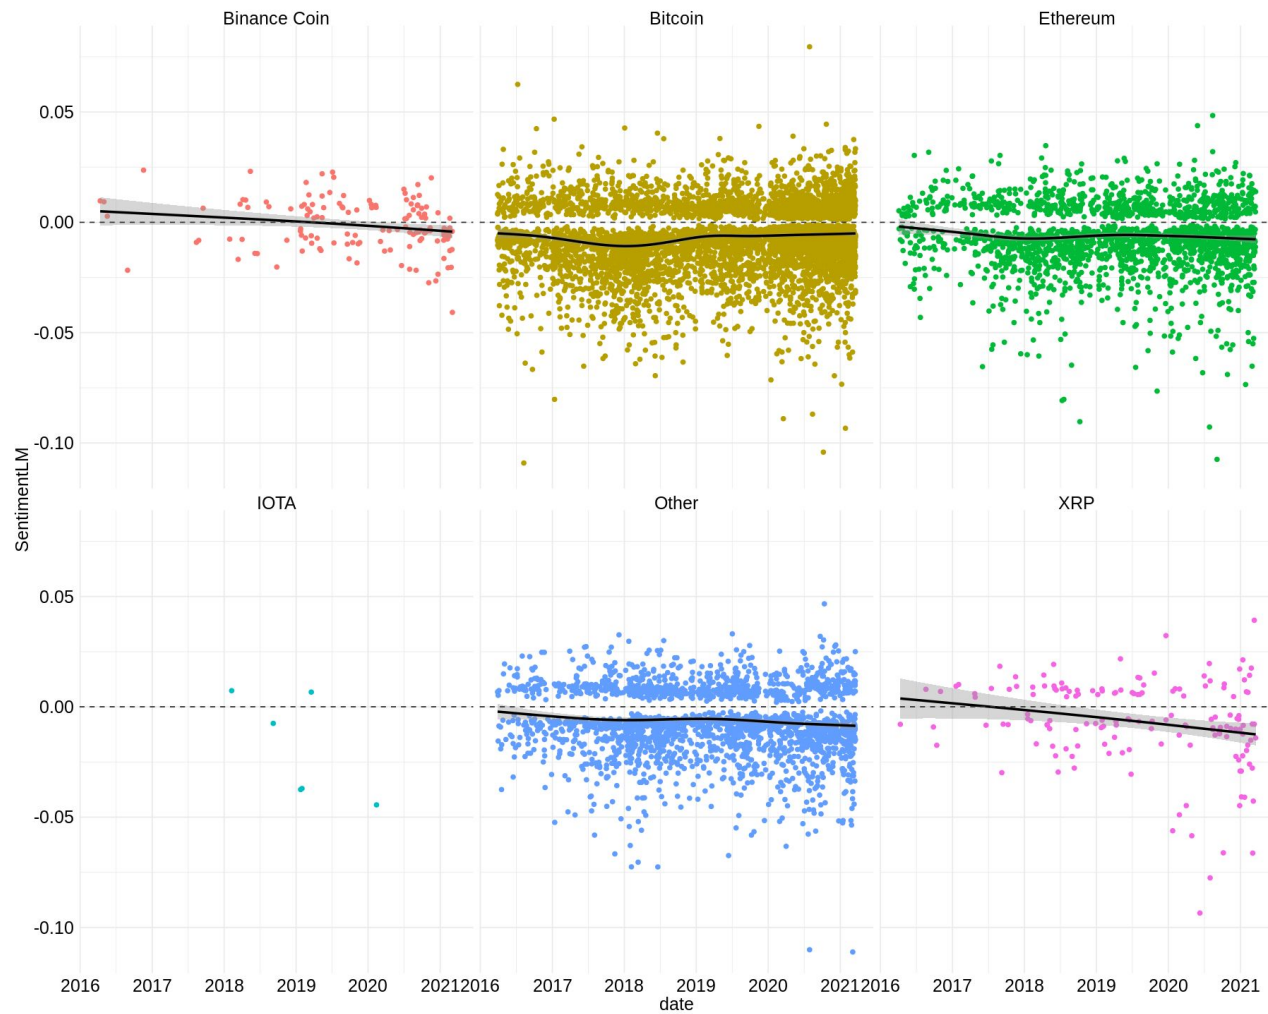

Accumulated Local Effects

ALE plot illustrates how features affect the prediction of a model on average

- Works by changing values of one feature at the time
- ALE plots describe how the prediction would change in response to the change of the feature
- Isolates the effect of the feature and excludes the effect of correlated features
- We chose it over PDP, since ALE works better with correlated features

Daily returns

Average 10-day future volatility

The model

Hidden layers: 1 (LSTM)

Units: 5

Activation function: Tanh

Epochs: 4,000

Batch size: 64

Loss function: MSE

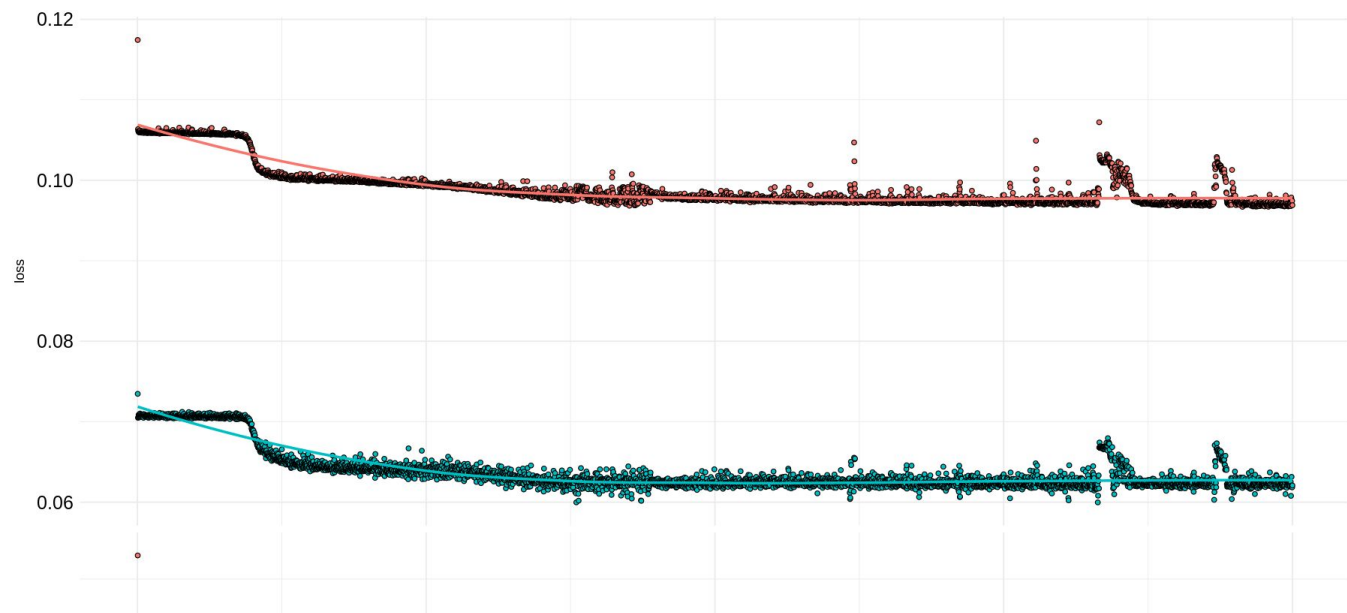

Optimizer: ADAM

Fit

Loss: 0.097

Val loss: 0.062

ALE results

- X-axis indicates the daily changes, except for sentiment data
- Y-axis indicates the effect on future 10-day volatility
